                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABF5124 to ABF3796. The s. epidermidis sequences rave antibocterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to seriem for compounds abin to interfere with the S. epidermidis life region.

N. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

(1) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (1) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAH52304 to AAH53970 represent nucleic acids (1) encoding polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        130 NSIANETIQIINKPIGVTAGIVPWNAPILVLMRKVIPAIVTG/SVVIAPSEETILLEILR. 189
            priyequides. The priyequides (II) (and/or on Los ands) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identity compounds that may be used for the treatment of S epidermidis infertions, or a end-carditis. AAHS 971 to AAHS 509, represent specifically claimed S epidermidis queomic DNA polynucleotide sequences from the present invention. AAHS 5091 to AAHS 5098 represent oliqonate decide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SMO ID No.4454 so even thereby sequences are given in the disclosure for SMO ID NO.4465 to 4472, no sequences are present for SMO ID No.4455 to 4464.
containing them which are used to produce hosts cells which express the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9 MYIDGGFVTWRGDAWIDVVNPATEAVISRIPDGGAEDARKAIDAAERAQPEWEALPATER

                                                                                                                                                                                                                                                            for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to someounds in rational drug discovery programmes. The antisense nucleic acids which are required for useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        70 SWLRKISAGIPEFASEISALIVEEGGKIQQLAFVEVAFIALYIDYMAEWARRYEGEILQS 129

                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense inhibitors of genes essential to provary in scillular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential sense themselves and the encoded proteins. The prokaryotes used are Escherichia coli, staphylococcus and Enterosoccus faccilis. The pronunciae, Pseudomonas aeruginusa and Enterosoccus faccilis. The invention is also useful for the identification of potential new targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10 YILKGÇEVTWEGDAMIDVVNPATEAVISETPENGAFDARKALDAAEPAQPEWEALPAIERA 59

The invention is also useful for the identification of potential new targets for antibicità develepment. The attisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The proteins can be used to screen compounds in rational drug discovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the enoughd provisins the prokaryotes used are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ohlsen KL, Zyskind JW, Wall D, Trawick JD, Carr GJ;

 vaccines compositions for the treatment or prevention of infections by L.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
 5 VQHPMYIDGQFVTWRGDAWIDVVNPATEAVISRIPDGQAEDARKAIDAAERAQPEWEALP 64
 monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Floteins expressed from the genome sequence are useful for raising specific
 antibudies, identification of L. memorytopones and related organisms, an for biosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and profeins encoded by it are also useful for
 selecting compounds that requiate gene expression and cell replication and modulate L monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in phaimaceutical and
 for treatment

 Perfect score.
 N⊙.
Pred. No. is the number of results predicted by chase to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution

```
^3\text{-Hydroxypropionic} acid preparation, for use e.g. as monomer, by fermenting recombinant microorganisms expressing genes for suitable enzymes in the presence of qlycerol or glucose -
```

26-SEP-2001 (first entry)

AAC92818;

Claim 5; Page 46-48; 63pp; English

The present invention describes a method for the production of 3-hydroxypropionic acid (3-HP). The method comprises fermenting a recombinant microorganism in the presence of a source of glycerol (1) or glucose, where the microorganism: (1) expresses genes for non-native enzymes which catalyse the production of (3-HP) from (1); (1) carries genetic constructions for the expression of allycerol dehydratase (GBHT) and aldehyde dehydrogenase (ABH) capable of catalysing the production of (3-HP) from (1); or (ii) carries a genetic construct an ABH capable of ratalysing the production of (3-HP) from (1). In Mileostella premunoines and a gene for an ABH capable of ratalysing the production of (3-HP) from (1). 3-HP is a monomer, and is useful e.g. in the production of absorbable prosthetic devices and surgical sutures or for incorporation into beta-lactams, production of actylic acid or formation of trifluoromethylated alcohols Incorporation of genes encoding two enzymes makes the host organisms able to produce (3:HP) from (1). The biotechnological method of preparing (3:HP) is potentially cheaper than chemical synthesis. The present sequence represents the E. coli aldehyde dehydrogenase aldb, which is used in the exemplification of the present invention. or diols, polyhydroxyalkonates and copolymers with lactic acid

programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
 The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruqinosa and Enterococcus facerlis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used

 invention. The INA sequences encoding the Staurous proteins are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read only memory (RAM) or 10 RAM. Homelogy searches using the Staurous ENA sequences allows putative functions to be assigned so that protein encoding or requising regions.
 This sequence represents a Staphylococcus anreus protein sequence of the
 of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode actious have been identified and these polypeptides can be used in a vaccine composition against Scaurens infection of Each properties can also be used in a kit for the immunodetection of Scaurens in a sample. Scaureus is implicated

New genetic variants with polymorphisms in the aldehyde dehydrogenase 5 (ALDH5) gene, useful for studying the function of ALDH5, and for expressing ALDH5 protein which is useful in screening drugs for treating ALDH5-related diseases

Claim 30; Page 72-74; 96pp; English

This invention describes a novel isolated genes and haplotypes of the human aldehyde dehydrogenase 5 (ALDH5) gene containing polymorphic sites. The polymorphic ALDH5 variant is useful in studying the effect of the variation on the biological activity of ALDH5 and on the biological ALDH5 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. The products of the invention have antialcoholic activity. This sequence represents the human ALDH5 protein described in the disclosure of the affinity of candidate drugs targeting ALDHS for the treatment of alcoholism and alcohol-induced disorders. Polynucleotides comprising a polymorphic gene variant or fragment may be used for therapeutic purposes. ALDHS protein isoforms may be used in assays to measure the binding affinities of one or more candidate drugs targeting the ALDHS proteins may be used to generate antibodies. Haplotyping method can be used by scientists to validate ALDHS as a candidate target for treating a specific condition or disease predicted to be associated with ALDHS activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be candidate drugs for treating a specific condition or disease predicted to be to be associated with ALDHS activity. Information on polymorphisms on the ALDHS query and in the ALDHS protein or disease predicted to be applied for studying the biological function of

New genetic variants with polymorphisms in the aldehyde debydrogenase 5 (ALDH5) gene, useful for studying the function of ALDH5, and for expressing ALDH5 protein which is useful in screening drugs for treating ALDH5-related diseases

Disclosure: Fig 3: 96pp; English.

This invention describes a novel isolated genes and haplotypes of the himan abdehyde debydroenase 5 (ALMIS) gene containing polymorphic sites. The polymorphic ALDHS variant is useful in studying the effect of the variation on the biological activity of ALDHS and on the binding variation on the biological activity of ALDHS for the treatment of alforded is made already activity of ALDHS for the treatment of polymorphic gene variant or tragment may be used for their appearing protein isological may be used for their appearing binding affinities of one or more candidate drugs targeting the ALDHS proteins may be used to the agraphic protein ALDHS proteins may be used to generate altihodies. Haplotyping ALDHS as well as in identifying drugs fargeting this protein for the treatment of disorders related to its abnormal expression or function. The products of the invention have antialcoholic activity. This sequence represents the human ALDHS polymorphic variant protein described in the disclosure of the invention. method can be used by scientists to validate ALDH5 as a candidate target for treating a specific condition or disease predicted to be associated with ALDH5 activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with ALDHS activity. Information on polymorphisms on the ALDHS gene can be applied for studying the biological tention of

 3-hydroxypropionic acid (3-HH). The method comprises formenting a recombinant microcrapia is in the presence of a source of glycerol (1) or glucose, where the microcranism in (1) expresses genes for non-native enzymes which catalyse the production of (3-HP) from (1); (1) carries genetic constructions for the expression of a glycerol dehydradase (5EHF) and aldehyde dehydrogenese (4EHF) from (1); or (11) carries a genetic construct which expresses the dhas gene from Klebsiella procumoniae and a gene for an AHF capable of catalysing the production of (3-HP) from (1). 3-HP is a monomer, and is useful e.g. in the production of dassorbable prosthetic pervises and surgical autures or for incorporation into beta lactams, production of acrylic avid or formation of tilluminethylated aluchols or diols, polyhydroxyalkonates and expenses.
 Incorporation of genes encoding two enzymes makes the host organisms able to produce (3-HP) from (1). The biotechnological method of preparing (3-HP) is potentially cheaper than chemical synthesis. The present sequence represents the yeast aldebyde dehydrogenase ALD4, which is used in the exemplification of the present invention.
